#### 1.1.2. Normative di calcolo

UNI EN1990-1-1:2004, Eurocodice 0 Parte 1-1, Basi di calcolo

UNI EN1991-1-1:2004, Eurocodice 1 Parte 1-1, Azioni sulle strutture

DM2008, §3.4, Azioni della neve

DM2008, §3.3, Azioni del vento

UNI EN1995-1-1:2009, Eurocodice 5 Parte 1-1, Progettazione delle strutture di legno

#### 1.1.3. Metodo di calcolo

Gli sforzi interni alla capriata sono calcolati mediante analisi ad elementi finiti. La capriata è considerata come un elemento trave reticolare a due dimensioni. La rigidità delle unioni è modulata secondo il grado desiderato di rigidità. Per calcolare il valore di progetto degli sforzi interni, gli sforzi interni sono dapprima calcolati come sforzi unitari e successivamente, dalle loro combinazioni si ottengono gli sforzi interni nelle varie condizioni di carico. Tutte le combinazioni di carico previste dall'Eurocodice 5 sono considerate, e le verifiche sono svolte nelle condizioni di carico più sfavorevoli, per le combinazioni di carico, allo stato limite ultimo di progetto, secondo EN1995-1-1, §6. Le giunzioni sono considerate come unioni con bulloni con piastre metalliche e sono dimensionate secondo EN1995-1-1, §8. In aggiunta le deformazioni sono verificate nello stato limite di servizio, secondo UNI EN1995-1-1:2009, §7.

### 1.6. Progettazione dei travetti

#### Sistema strutturale dei travetti

I travetti sono progettati come travi semplicemente appoggiate con luce  $L=1.800\text{m}$  che è la distanza tra le capriate. Essi sono sottoposti ad un carico di superficie di larghezza  $L_1=0.300\text{m}$  (interasse tra i travetti). L'asse dei travetti ha un'inclinazione  $\alpha=45.38^\circ$  sulla verticale. I carichi verticali (peso proprio, neve, peso del carpentiere) sono scomposti in due componenti nelle direzioni z-z  $P \cdot \cos\alpha$ , e y-y  $P \cdot \sin\alpha$ , la pressione del vento agisce nella direzione z-z.

#### Dimensioni dei travetti

Specie legnosa dei travetti: C22, Classe 1, umidità  $\leq 12\%$ , sezione dei travetti BxH: 75x100mm
